Candida zemplinina and *Candida stellata* are two closely related species and difficult to distinguish based on standard taxonomical methods and rDNA 5.8S-ITS PCR-RFLP (Sipiczki, 2003; Sipiczki *et al.*, 2005). At the time the manuscript has been accepted for publication, additional information has been obtained based on results generated from *MboI* and *DraI* restriction enzyme digests in rDNA 5.8S-ITS PCR-RFLP analyses (Csoma and Sipiczki, 2008). Based on these results, and sequencing of the 26S D1/D2 domains, the IRVV strains classified as *C. stellata* (referred to as *Cs1* and *Cs14* in the manuscript), have to be reclassified as members of the species *C. zemplinina*, as described by Romancino *et al.* (2008). This is in agreement with findings published by Sipiczki *et al.* (2005) and Csoma and Sipiczki (2008).
